Abstract

The invention relates to a device for locking and unlocking a vehicle door (2) with a door handle (4) which is attached to the outer side thereof and an unlocking sensor (6), arranged in the door-end internal region of the door handle (4), for unlocking the door (2), wherein the vehicle door is secured by an electronic access authorization system.

The invention proposes that an identification sensor (8) is additionally provided in the vicinity of the door handle (4) and an identification code interrogation by the access authorization system can be started with said identification sensor (8).
